the existence and qualitative properties of nontrivial solutions for some important nonlinear schrödinger systems have been studied in this thesis for a well known system arising from nonlinear optics and bose einstein condensates bec in the subcritical case qualitative properties of ground state solutions including an optimal parameter range for the existence the uniqueness and asymptotic behaviors have been investigated and the results could firstly partially answer open questions raised by ambrosetti colorado and sirakov in the critical case a systematical research on ground state solutions including the existence the nonexistence the uniqueness and the phase separation phenomena of the limit profile has been presented which seems to be the first contribution for bec in the critical case furthermore some quite different phenomena were also studied in a more general critical system for the classical brezis nirenberg critical exponent problem the sharp energy estimate of least energy solutions in a ball has been investigated in this study finally for ambrosetti type linearly coupled schrödinger equations with critical exponent an optimal result on the existence and nonexistence of ground state solutions for different coupling constants was also obtained in this thesis these results have many applications in physics and pdes

this book offers the first comprehensive presentation of measure valued solutions for nonlinear deterministic and stochastic evolution equations on infinite dimensional banach spaces unlike traditional solutions measure valued solutions allow for a much broader class of abstract evolution equations to be addressed providing a broader approach the book presents extensive results on the existence of measure valued solutions for differential equations that have no solutions in the usual sense it covers a range of topics including evolution equations with continuous discontinuous vector fields neutral evolution equations subject to vector measures as impulsive forces stochastic evolution equations and optimal control of evolution equations the optimal control problems considered cover the existence of solutions necessary conditions of optimality and more significantly complementing the existing literature this book will be of great interest to researchers in functional analysis

partial differential equations dynamic systems and their optimal control and their applications advancing previous research and providing a foundation for further exploration of the field

the linear programming method is one of the important methods of operations research that has been used to address many practical issues and provided optimal solutions for many institutions and companies which helped decision makers make ideal decisions through which companies and institutions achieved maximum profit but these solutions remain ideal and appropriate in if the conditions surrounding the work environment are stable because any change in the data provided will affect the optimal solution and to avoid losses and achieve maximum profit we have in previous research reformulated the linear models using the concepts of neutrosophic science the science that takes into account the instability of conditions and fluctuations in the work environment and leaves nothing to chance while taking data neutrosophic values carry some indeterminacy giving a margin of freedom to decision makers in another research we reformulated one of the most important methods used to solve linear models which is the simplex method using the concepts of this science and as a continuation of what we did in the previous two researches we will reformulate in this research the graphical method for solving linear models using the concepts of neutrosophics we will also shed light on a case that is rarely mentioned in most operations research references which is that when the difference between the number of unknowns and the number of constraints is equal to one two or three we can also find the optimal solution graphically for some linear models this is done by taking advantage of the conditions of non negativity that linear models have and we will explain this through an example in which the difference is equal to two also through examples we will explain the difference between using classical values and neutrosophic values and the extent of this s impact on the optimal solution
